

Backend Engineering Assignment

Thanks for interviewing with us. This assignment is meant to be short and open-ended — we're less interested in a "finished product" and more interested in how you think through an ambiguous problem and use AI coding tools to solve it.

The Assignment

Desktop Application Automation

1. Build a simple no-code automation tool to test Desktop UI applications that are built on .NET Framework.
Reference: Tricentis Tosca
2. Build a tool that can identify and interact with legacy Win32 desktop application controls without relying on image-based recognition.
Reference: Tricentis Tosca / Ranorex

That's it — intentionally brief. Part of the exercise is deciding for yourself what "done" looks like within the time you have.

What We Want You to Use

You're expected to use AI coding tools (Claude, ChatGPT, Cursor, Copilot, GitHub Copilot Workspace, whatever you prefer) to build this. We're not testing whether you can write every line yourself — we're testing whether you can:

- Break a vague problem into the right smaller problems
- Direct an AI tool with clear, specific prompts to get useful output
- Recognize when the AI gets something wrong and course-correct
- Make and justify your own technical decisions, rather than accepting defaults

What to Submit

Please submit all three of the following. All three matters — submissions missing the prompt log or README will not be evaluated fairly, regardless of how good the code is.

1. **Your code** — as a zip, GitHub repo link, or similar.
2. **Your full prompt history** — the actual chat log(s) with whatever AI tool(s) you used, unedited. This is genuinely as important to us as the code itself, so don't skip it or tidy it up.

3. **A short README** (half a page is plenty) covering:
 - What you understood the problem to be
 - What you chose to build, and what you deliberately left out — and why
 - Any assumptions you made
 - What you'd do next with more time

Time Expectation

Aim to spend around **a day** on this. We're not expecting a production-grade tool — a working core of the idea, thoughtfully scoped, is worth more than a half-broken attempt at something bigger.

A Few Ground Rules

- It's completely fine (expected, even) to explore the reference tool we mentioned to understand what it actually does before you start building.
- If the domain is unfamiliar to you (e.g. SAP, Salesforce, desktop automation), it's fine to make reasonable assumptions — just state them.
- Come to the follow-up conversation ready to walk through your code and your prompting choices. We'll ask you to explain specific parts live, so make sure you understand what you submitted, not just what the AI produced.

Questions

If anything about the assignment is ambiguous, that's by design — use your judgment and note your interpretation in the README. If something feels genuinely broken or unclear (not just open-ended), reach out to us at **Heet Vinod Gajra**

Good luck — we're looking forward to seeing how you think.
